

PREPARATION FOR CARPENTER ANT TREATMENT

To help **resolve** a carpenter ant infestation in your home it is necessary to follow these guidelines:

1. Resolve any moisture issues. I.e. leaks/drainage.
2. Remove any food sources such as sugary spills and garbage.
3. Move furniture away from the baseboard (1 foot preferably)

Treatment

Carpenter ants typically infest areas where moisture is an issue such as areas around dishwashers or wood that is water damaged.

To solve a carpenter ant infestation, it is important to locate and treat the nest area and resolve the moisture issues.

A general baseboard treatment will be done to help control any foraging

ants. Insecticide sprays, dusts and / or ant bait may be used.

Post Treatment Information

Following the treatment, any baits that were used **must** be left where the technician has placed them.

Do not wash the baseboard areas for at least 3 weeks after the treatment.

DO NOT spray any insecticides or use cleaning chemicals on or near the bait placement.

It is necessary for you to remove all pets, cover fish tanks and remain out of the unit for approximately 4 – 6 hours following the treatment. If you have any respiratory or other medical issues it is recommended that you stay out of the unit for 24 hours.
